

Example Document

Showcasing Quarto's Multi-Format Exports

Version: 1

Table of contents

Format Configuration 1

Features Demonstrated 2

 1. Callout Boxes 2

 2. Math & Code blocks 2

 3. Native Layouts 2

This page serves as a live demonstration of how to export individual documents into multiple formats (PDF, Word, OpenDocument, EPUB, and GitHub Flavored Markdown) directly from a single Quarto Markdown (.qmd) source.

You can download any of the generated alternate formats using the **Download** links shown at the top of the sidebar.

Format Configuration

To generate these outputs, specify the desired formats in the document's YAML front matter:

```
format:
  html: {}
  typst:
    toc: true
    toc-depth: 2
    number-sections: true
    template: ../_extensions/typst-template.typ
    template-partials:
      - ../_extensions/typst-show.typ
  odt:
    toc: true
  epub:
    toc: true
  docx:
    toc: true
```

```
gfm:
  toc: false
```

Features Demonstrated

1. Callout Boxes

We include custom CSS/Typst styles for callouts. Here is an example:

i Note

This is a standard callout note. It renders with a clean left border and specific color matching the style theme.

2. Math & Code blocks

You can write code blocks and mathematical formulations:

$$E = mc^2$$

```
def hello_world():
  print("Hello from Quarto!")
```

3. Native Layouts

Table alignments and figure layout work flawlessly across HTML, Typst (PDF), and EPUB formats.
